Underutilization

Toujeo, Tresiba, and Metformin 1000mg must be used compliantly and will reject on point of sale for late fill

Therapeutic Duplication

- One Strength of one medication is allowed at a time
- Medication classes not payable together:
 - DPP4-Inhibitors and GLP-1 Agonists
 - GLP-1 and DPP4-Inhibitors should not be used concurrently due to similar mechanisms of action
 - DPP4-Inhibitors and Insulins
 - GLP-1 should be considered in most members prior to insulin
 - When initiating injectable therapy, sulfonylureas and DPP-4 inhibitors are typically discontinued
 - Sulfonylureas and Insulins
 - When initiating injectable therapy, sulfonylureas and DPP-4 inhibitors are typically discontinued
 - Humulin R U-500 is not allowed with any other insulin (basal or prandial)

Humulin R U-500 is indicated for monotherapy. It acts differently than regular insulin (U-100). It
provides both basal and prandial coverage. Injections can be increased to 3 times per day for prandial
coverage.

Covered options in combination with Insulin therapy:

GLP-1 Agonists, SGLT-2 inhibitors, TZDs, and metformin.

- GLP-1 Agonist and SGLT-2 inhibitors are recommended first line treatments for every pathway indicated in the guidelines (ASCVD, HF, CKD, hypoglycemia risk, and to minimize weight gain)
- TZDs increase insulin sensitivity and hypoglycemia risk should be monitored
- Metformin is recommended throughout treatment escalation.

DPP4-Inhibitors

Electronic Age Verification

• The member must be 18 years or older for Januvia, Janumet, or Janumet XR

Electronic Step Care and Concurrent Medications

- <u>DPP4-Inhibitors require concurrent metformin</u>
 - A total of 56-day supply of metformin must be paid within 100 days prior to the DPP4-Inhibitor's date of service.
 - Metformin is recommended to be continued with escalation of therapy with DPP4-Inhibitors. If metformin is not tolerated, SGLT2 inhibitor and GLP-1 Agonists are recommended as part of the glucoselowering regimen independent of A1C and are first line alternatives.
 - Members with GI intolerances to high dose IR metformin should trial at minimum a dose of 500mg ER.

Etravirine: Guidelines do not recommend for treatment-naïve members due to insufficient data. FDA indication is for treatment experienced members and so should be reserved for salvage therapy, pretreated members with NNRTI resistance and PI exposure or who have ongoing adverse effects with first line therapies.

<u>Nevirapine:</u> Guidelines no longer recommend nevirapine for initial treatment of HIV infection in treatment-naïve members. In resource limited settings, it can be considered as a third agent. Nevirapine demonstrated inferiority relative to efavirenz and is associated with serious and fatal hepatic and rash events.

<u>abacavir/lamivudine/zidovudine</u> – Guidelines do not recommend ABC/3TC/ZDU (as either a triple-NRTI combination regimen or in combination with tenofovir (TDF) as a quadruple-NRTI combination regimen) due to inferior virologic efficacy.

<u>lamivudine/zidovudine</u> – Guidelines do not recommend ZDV/3TC due to greater toxicities than recommended NRTIs (including bone marrow suppression, GI toxicities, skeletal muscle myopathy, cardiomyopathy, and mitochondrial toxicities such as lipoatrophy, lactic acidosis and hepatic steatosis).

<u>didanosine</u> – Guidelines do not recommend ddl/3TC or ddl/FTC regimens due to inferior virologic efficacy, limited trial experience in ART-naïve members, and ddl toxicities (including pancreatitis and peripheral neuropathy). ddl/TDF regimens are not recommended due to high rate of early virologic failure, rapid selection of resistance mutations, potential for immunologic nonresponse/CD4 cell decline, and increased ddl drug exposure and toxicities.

<u>stavudine</u> – Guidelines do not recommend d4T/3TC due to significant toxicities (including lipoatrophy, peripheral neuropathy) and hyperlactatemia (including symptomatic and life-threatening lactic acidosis, hepatic steatosis, and pancreatitis)

<u>Fosamprenavir</u> – Guidelines do not recommend use of unboosted FPV or FPV/r due to virologic failure with unboosted FPV-based regimens that may result in selection of mutations that confer resistance to FPV and DRV. There is also less clinical trial data for FPV/r than other RTV-boosted PIs.

Lopinavir/ritonavir – Guidelines do not recommend LPV/r due to GI intolerance, higher pill burden and higher RTV dose than other PI-based regimens

Nelfinavir - Guidelines do not recommend use of NFV due to inferior virologic efficacy and diarrhea.

<u>Saginavir</u> – Guidelines do not recommend use of unboosted SQV due to inadequate bioavailability and inferior virologic efficacy or SQV/r due to high bill burden and QT and PR prolongation.

<u>Tipranavir</u> – Guidelines do not recommend TPV/r due to inferior virologic efficacy, higher dose of RTV and higher rate of adverse events than other RTV-boosted PIs.

 - One inhaled steroid
 - Long-acting anticholinergic
 - Leukotriene pathway inhibitor
 - o One long-acting beta agonist

- One short acting beta agonist

The following is a listing of NDCs that have been paid in the previous calendar year. This list is provided as a convenience to find a covered OTC NDC and will be updated yearly. Please note that NDCs listed here are not guaranteed to be covered as coverage requirements may change.

The best approach would be to start at the top of the list and move your way down to find an NDC that is reasonably able to be dispensed as it is listed by descending script volume.
